

## **PPA 3**

### **Title**

### **Evolving Nonlinear Truth Spaces and Non-Enumerative Logic Systems**

### **Field of the Invention**

The invention relates to logic systems, computation theory, artificial intelligence, and information theory.

### **Background**

Traditional logic systems rely on fixed truth tables, enumerable rule sets, and static logical relations. Even adaptive systems operate within predefined logical spaces.

Biological systems exhibit evolving logical constraints that cannot be enumerated in advance.

### **Summary of the Invention**

The invention discloses systems in which:

- Truth spaces are nonlinear and non-enumerable
- Logical relations evolve as structures persist
- Truth tables are not predefined but emerge over time

Logic is discovered, not specified.

### **Detailed Description**

Initial substrates contain symmetric equivalence classes. As transformations occur, symmetry breaking records distinctions. Persistent distinctions alter the space of allowable transformations.

Truth is defined as structural compatibility rather than symbolic correctness.

### **Key Novel Claims (Provisional)**

- Truth tables that evolve rather than execute
- Logic without predefined rules
- Non-enumerable logical spaces
- Structural truth rather than symbolic truth
